

Google Cybersecurity Certificate feedback

Ticket details

5 months ago

Dear Google,

Having exhausted all other opportunities for meaningful engagement by Google, I put this out here as feedback.

I enrolled as a serious professional. I paid the monthly subscriptions and invested many hours completing the Cybersecurity Professional Certificate because I trusted the brand. I believed that earning this credential meant something — that it showed real effort, real learning, and real ability.

That trust was shaken.

When I applied for a role within the same ecosystem that asked for the exact skills this certificate represents, my application was rejected instantly by Google. The job was then reposted almost immediately. It is hard to wonder the currency of this certificate if the value is ignored by the organization that sells it.

And this happened to me even after passing the CompTIA Security+ and with the Certificate as sufficient background for the role in the initial posting

CareerCircle is also disappointing. It was advertised as access to internal opportunities, including personal recruiters, but in reality, it feels like a basic job board with little structure or support and fragmented more than anything. There was no onboarding, no recruiter contact, and no clear process, no organization, nothing personal at all. None of the promised access seem to exist.

I cannot help but question whether this certificate is more symbolic than practical. There is an ethical misalignment here. It is difficult to justify the billing of a professional credential whose issuance carries little real weight, if at all, with the very same issuing agency. That risks turning people's career hopes into a source of revenue rather than offering a real path forward.

I really hope for the sake of those after me that my experience reflects a breakdown in process rather than intent. Google is a giant and even the fact that this is even an experience partnering with them is a shame. It is a disservice to the partner and it is a disservice to Google.
