

Dimension	Marketing Representation	Operational Reality per Google's Own Definitions	Classification
Google as Employer	Google hires certificate graduates (Pichai, February 17, 2022)	Mechanically impossible, no credential token, SSO; no preferential pipeline	Direct Contradiction
Outcome Statistic	75% achieve positive career outcome within six months	Self-reported; commercially surveyed; definition includes unrelated events; 2022 data applied in 2026	Statistical Integrity Issue

2.4 The Mechanical Impossibility Finding

The following describes the CareerCircle application sequence as experienced and documented by the inquirer. It constitutes the mechanical proof of the Design-Marketing Gap, independent of [REDACTED] definitions.

1. A credential-linked tag is displayed on a job listing within CareerCircle, associated with the applicable Google certificate (e.g., Google Cybersecurity Certificate on security roles).
2. Clicking the role or the tag redirects the user entirely out of CareerCircle to the employer's own public career page, the same page accessible by any member of the public without a Google certificate.
3. The applicant is required to create a fresh account directly with the employer. No single sign-on, credential token, or pipeline identifier carries forward from CareerCircle.
4. The application proceeds through the employer's own Applicant Tracking System. No data is transmitted from CareerCircle into that system. The ATS receives an application from an anonymous individual with no indication of CareerCircle origin, Google certificate status, or consortium context.

Mechanical Conclusion

The platform represents a direct connection between certificate holders and employers. The platform's architecture makes that connection mechanically impossible. No information about the certificate or the applicant travels from the platform that holds it into the system that processes applications. The represented connection is not a function that failed, it is a function that the system was never built to perform. The representation therefore does not describe an unfulfilled promise. It describes a non-existent mechanism.

This finding is independent of outcome quality, individual circumstances, or market conditions. It rests on the observable fact that the application process exits the credential-aware system before the employer's evaluation system is engaged. The tag tells the applicant which roles to consider. It tells the employer nothing. The direction of information flow is opposite to what the marketing implies.
